Plan

- ① Subject
- ② Handover algorithm
- ③ Log file
- ④ Study of parameters effects
- ⑤ Conclusion

Subject

Inputs for each BTS :

- P_e : Emission power
- G_e : Emission gain
- F : Frequency
- HO_MARGIN : Minimum marge between two signals to allow handover ;
- MS_TXPWR_MAX : Maximum emission power allowed to be used by the MS in a cell.

- **BTS_TXPWR_MAX** : Maximum emission power allowed to be used by the BTS in a cell.
- **RXLEV_MIN** : Electromagnetic field level to access to a cell.
- **MAX_MS_RANGE** : Maximum distance between Mobile Station and BTS.
- **L_RXQUAL_H**: Minimum quality to allow handover.
- **L_RXLEV_DL_H** : Minimum received level to allow handover on downlink.
- **L_RXLEV_UP_H** : Minimum received level to allow handover on uplink.

Inputs for each Mobile Station (MS) :

- P_e : Emission power
- G_e : Emission gain
- P : Maximum Emission Power of the MS

Outputs

- Log file
- Graphic interface with MS colored in the BTS color it is linked (Python language)

Handover algorithm

- Measure phase : RxLev uplink and downlink, RxQual uplink and downlink, Distances between MS and BTS each 40ms
- Mean phase on 12 samples each 480ms
- Storing between 8 and 12 means
- Construct neighbour list, looking measures of other cells
- For each cell of the neighbour list, decide if handover is possible.
- If handover is possible, the order to change of bts must be repeated 3 times.

Log file

-
-

Study of parameters effects

- Overlap between BTS
- Handover margin
- Number of orders to change from a BTS to another

- High overlap and weak ho margin
 -
- High overlap and strong ho margin
 -

- Low overlap and weak ho margin
 -
- Low overlap and strong ho margin
 -

Conclusion
